Orbit Backup Tool: Command Reference

1 Installation

Orbit runs on Linux and Windows. After installation, register the machine with the backup server:

```
orbit register --server backup.example.org
orbit --version
orbit 4.2.1
```

2 Daily use

2.1 Starting a backup

A backup of the default profile starts with the command below; it prints a job number.

```
orbit backup start --profile default
job: 5521
state: queued
```

2.2 Restoring files

To restore a single folder from the last backup into a separate directory, run:

```
orbit restore --path /srv/data --target /tmp/restore
restored: 1,204 files
```

3 Retention

Daily backups are kept for 30 days, weekly backups for 26 weeks and monthly backups for 7 years. The retention can be shortened per profile but never extended beyond these limits.

4 Troubleshooting

If a backup stays queued for more than one hour, check the connection to the server:

```
orbit doctor --network
server: reachable
latency: 18 ms
```
